validator receiver configured to receive data signals;  
a data transmitter in contact with a human nail and in  
communication with the validator controller; and said data  
transmitter relying upon the physical properties of the nail  
and surrounding areas; wherein the data transmitter transmits  
a data signal, the validator receiver receives the data signal,  
the validator logic circuit processes the received data signal,  
and the validator status actuator performs an action based upon  
the received data signal, said validator receiver being capable  
of selectively receiving said data signals around said nail  
and surrounding areas.

7. (Once Amended) A security apparatus, comprising:  
a validator controller having a validator status actuator in  
communication with a validator receiver via a validator logic  
circuit, the validator status actuator configured to process  
and perform actions based upon data signals, and the  
validator receiver configured to receive data signals;  
a data transmitter in contact with a human nail and in  
communication with the validator controller; and said data  
transmitter relying upon the physical properties of the nail

and surrounding areas; wherein the data transmitter transmits a data signal, the validator receiver receives the data signal, the validator logic circuit processes the received data signal, and the validator status actuator performs an action based upon the received data signal, said validator controller further comprises a validator emitter configured to emit signals towards the data transmitter, said data transmitter further comprises a nail digital chip configured to communicate with the validator receiver; and a nail solar cell configured to receive signals from said validator emitter and power the data transmitter.

21. (Once Amended) A method of enabling or disabling an event, comprising the steps of:

providing a validator controller having a validator status actuator in communication with a validator receiver via a validator logic circuit, the validator status actuator configured to process and perform actions based upon data signals, and the validator receiver configured to receive signals, a data transmitter in contact with a human nail and in communication with the validator controller and relying upon

the physical properties of the nail and surrounding areas; receiving a data signal by the validator receiver; processing the received data signal by the validator logic circuit; and performing an action by the validator status actuator based upon the received data signal, receiving selectively by said validator receiver said data signals at selected positions around said nail and surrounding areas.

22. (Once amended) The apparatus according to claim 1, wherein the physical properties of the nail and the surrounding areas relied upon by the data transmitter are selected from the group electrical, magnetic, ultrasound responsive properties, tactile, electromagnetic naturally or artificially occurring, created or modified properties and its surroundings.

Please insert new claims 24, 25 and 26 as follows:

24. The security apparatus of claim 1 wherein said validator receiver is capable of receiving said data signals substantially above said nail and surrounding areas.

25. The security apparatus of claim 1 wherein said validator receiver is capable of receiving said data signals substantially below said nail and surrounding areas.
